

Solution App feedback - Overall

Fonts

- Please update font and backups to be: "NationalWeb", Helvetica Neue, Helvetica, Roboto, Arial, sans-serif

Navigation

- Remove "Overview" and "Journeys" at the top right of the header, when on the Personas tab. They are duplicates.

Terminology

- Change all instances of VCC to DVC

Personas Overview

- 'Today' bullet points are very generic, and do not cover the priority pain points discussed in the workshops - please rewrite all to ensure they cover the pain points covered on the 'current state journeys and pain points pages' of this pack, e.g.
 - Time to competency for consultants
 - Room for error
 - Not capturing critical details (e.g. reference number and policy number)
 - Time consuming reconciliation processes, matching bank statement lines with tramada costs line by line
 - Lengthy and complex process to rectify mismatches, e.g. multiple payments for one cost in Tramada
- Tomorrow bullet points need to reflect the flip side of 'today' bullet points
- Some personas are named after meeting attendees - please change all persona names to be made up names, not based on a specific person
- Remove specific reference to 'seven' systems - we may not know the specific number of systems

Journeys

Replace current journey example for Sarah with two example journeys:

- High level overview - end to end process visual for current state only (high level steps and pain points)
- 'Today' scenario example - reference 'Scenario 01: Customer credit card payment and reconciliation'
- Placeholder for 'tomorrow scenario - show layout for a future state journey for scenario 01, but with layout only with 'Placeholder' text

Challenges

- Please consolidate challenges so there are fewer individual challenges and more detail for each - some challenges are currently quite similar (e.g. C30 and C45)
- Add more specific detail and context to each challenge, e.g. for C2, specify what specifically takes up so much time as part of post-consultation admin, and the impact of this.
- Reference 'current state journeys and pain points pages' in this pack and ensure the pain points listed are captured in challenges

Personas feedback - Sarah Mitchell

Suggest also covering under 'Today'

- Easy to make financial errors and miss keying in critical details
- No upper limit on supplier payment transactions
- Long time to competency for new starters

Please reference current state journey content (scenarios 1-6) for relevant current state process sand pain points.

Chasing client for payment the chasing screenshot is not a regular pain point as I understand.

Sarah Mitchell

Travel Consultant

Retail-store and phone-based consultant taking a family holiday from first enquiry through to invoice — the primary lane in every AS-IS diagram.

TODAY

- Every non-Amadeus segment keyed by hand
- Hops Tramadax, Amadeus, MINT, IPSI, LastPass and supplier portals per booking
- Chases the client for payment, then chases the screenshot
- Documents scattered across Y: drive and a personal mailbox

TOMORROW

- Supplier content flows into segments automatically
- One workspace with the payment path built in
- Member self-serves payment; receipting fires on settlement
- Documents and acceptance attached to the booking record

Should cover the impact of reduced errors and time to competency once AI takes over from manual entry / detects errors.

Should also cover reduced time to competency.

KEY BENEFIT

More time selling travel, far less time re-keying it

"Spend the day advising members on travel, not re-keying the same booking into seven systems."

PERSONAS AFFECTED

 Nadia Rossi ·Accounts Team Officer

LINKED CHALLENGES (1)

C20 HIGH

30–60 minutes of manual bank downloads every morning

THINGS TO CHANGE:
Timing might take longer than 60 minutes, varying based on spreadsheet size.

C2

CRITICAL

T2 · MANUAL RE-KEYING & DATA QUALITY

Sarah · Travel Consultant

Post-consultation admin dominates the role

The booking conversation itself is efficient. The administrative tail behind it is where consultant capacity is consumed.

"The biggest cause of inefficiency that we heard was that after-consultation admin." — "Which is the Tramada side, yeah."

Source: Tramada demo.docx — SME transcript

2.3.1

2.3.8

3.2.1

THINGS TO CHANGE:

C2 is too vague of an explanation, the main issue is the time taken to receipt customer payments post consultation and not just that it dominates the role, elaborate on the how, why.

Severity should also be high rather than critical.

C35 CRITICAL T1 · INTEGRATION VOID Tom · Product / Travel Support Officer

No supplier APIs at all, so master data can never self-heal

Without integrations, every correction is manual and the same errors recur across bookings.

"Currently no API integrations." RAA is separately creating a POC to automate travel segment creation.

Source: process_challenge.pdf — current-state service blueprint

5.2.2

5.2.5

THINGS TO DO:

Self-heal is unclear, make statements more straightforward, such as for this case, change it to something like "No supplier APIs at all, master data is not saved and must be manually replicated which increases room for error"

C27

HIGH

T7 · CAPABILITY BURDEN

Megan · Training & Development Consultant

Amadeus is a DOS-era GDS with a graphical veneer

The reservations system is powerful but has a steep, unforgiving learning curve even with point-and-click added.

"It's like a DOS based system and now has got some integration with graphics so you can do point and click... It's just a big system to learn."

Source: Tramada demo.docx — SME transcript

5.1.2

5.3.2

THINGS TO DO:

Title is too high level, break it down into simpler terms, or branch out on the terms instead of using annotations. Be clearer with description still vague.

CI2

HIGH

T6 · NO MEMBER SELF-SERVICE

 Sarah · Travel Consultant

Chasing the client for acceptance, payment and evidence

Quote review runs days to weeks, then the consultant follows up for payment and again for a payment screenshot.

AS-IS itinerary flow annotates "Review Time: Days/Weeks" on the client review loop.

3.3.9 3.3.10

C30 **HIGH** T2 · MANUAL RE-KEYING & DATA QUALITY Megan · Training & Development Consultant

Human error drives inconsistent data that surfaces later as finance problems

Manual entry on most details produces inconsistency that only becomes visible in reconciliation and reporting.

"Manual data entry on most details." / "Inconsistent data due to human errors."

Source: process challenge.pdf — current-state service blueprint

5.4.2 5.4.3

C50 **HIGH** T2 · MANUAL RE-KEYING & DATA QUALITY Sarah · Travel Consultant

Shortcuts that save the agent seconds cost finance hours

Under pressure to sell, consultants skip steps intending to return to them and rarely do. The saving is measured in seconds at the front and the cost in hours at the back.

"It might save them 20 seconds here and a minute here... what they're not understanding is the flow-on effect it has on the travel accounts team." / "Make it easy to do the right thing and hard to do the wrong thing."

Source: meeting2.docx — Discovery Workshop, 23 Jul 2026

4.4.1 5.4.2

MERGE:

Consolidate challenges C45, C30, and C50 into a 2 challenges:

- One should highlight the financial cost of human error (e.g. agent adds an extra 0)
- One should highlight the time and effort burden on finance team to rectify errors

C32 HIGH T2 · MANUAL RE-KEYING & DATA QUALITY Tom · Product / Travel Support Officer

Hotel names and addresses hand-typed, creating duplicates

When a hotel is missing from the list, its name and address are typed manually — producing duplicate and dirty master data.

"Hotel Name & Address are manually populated if it does not exist in the existing Hotel List."

Source: booking process.pdf — AS-IS process pack v0.3

2.4.1

5.4.2

UPDATE:

Expand C32 to include manual re-entry of customer details as well. Clarify the impact of this challenge is room for error and inconsistent data capture

C43 **CRITICAL** **T7 · CAPABILITY BURDEN**  Heath · Travel Finance & Commercial

Volume tripled since COVID on unchanged finance headcount

Sales, agents and transactions have all roughly tripled while travel accounts staffing has not moved — so three times the errors are fixed by the same team, and the backlog compounds.

"We've basically tripled our sales... tripled our agents... but we've got the same amount of travel account staff as before COVID. Three times bigger comes with three times more errors... it's just a vicious circle."

Source: meeting2.docx — Discovery Workshop, 23 Jul 2026

Process flows feedback - Overall

Connecting lines

- Never go through another activity box when connecting one activity to another activity box
- Never go through a decision when connecting one activity to another activity box
- Create separate lines when there is back and forth from one activity box to other activity boxes
- For decision diamond, only allow one connecting line to connect to one point/edge of the diamond.

01. Create travel booking

01. Create travel booking

01. Create travel booking

02. Search for client / Add client

02. Search for client / Add client

03. Issue Client Itinerary

04. Search / Add hotels

05. Accept client payment

07. Create Debtor Payment Receipt

SWIMLANES ■ Travel Consultant / Accounts Team ■ Client ■ Tramada

16 STEPS • 3 LANES

Connecting lines should not go behind any decision box or step box

08. Create Agency CC Debtor Receipt

This step is for travel consultant, move it up to the above swimlane

09. Create Agency Creditor Payment

This step is for travel consultant, move it up to the above swimlane

10. Create Debtor Invoice

13. Client payments: BPay

Follow process map provided by RAA, exactly. Too many errors found on process flow

13. Client payments: Direct Deposit

Follow process map provided by RAA, exactly. Too many errors found on process flow

15. Daily Bank Statement Reconciliation

Scenario 01: Customer credit card payment and reconciliation

Manual receipt capture with lengthy follow up for missing details

Consultant manually receipts a phoned-in card payment across two systems (IPSI and Tramada).

Accounts reconciles the daily bank statement against Tramada line-by-line; any payment that can't be matched is chased manually across the network.

Human Actions

Pain Points

Customer Payment

Customer

Travel Consultant

Launch payment & capture card: Consultant launches the IPSI portal and starts a debtor payment receipt in Tramada. Asks the customer their card type, selects a matching dummy card from LastPass under "card number," and overrides the cardholder name field with the customer's actual name.

Allocate & submit: Allocates the cost to segments via checkbox, copies the total into Amount Received, ticks "include service fee," and copies the resulting Total Amount to Receipt into IPSI. Talks the customer through entering their card number and expiry via phone keypad.

Reference entry: Once IPSI confirms, manually types the store branch code plus the IPSI transaction reference into Tramada's Reference Number field — a mandatory step for later tracing, but not a mandatory field in the system itself.

- Complex, multi-system, multi-field process contributes significantly to new consultants' time-to-competency
- Cardholder name and reference number are non-mandatory fields, so they're easy to skip under time pressure
- No system check that amount received matches allocated segments before submission

Reconciliation

Accounts

Pull settlement data: Accounts downloads the daily Westpac (or Nuve) merchant settlement report, which shows one lump total per shop/channel — not itemised by customer or booking.

Match by total, not by line: In Tramada, filters "finance merchant payment receipts" by that shop's code for the day, totals every individual consultant receipt, and checks the total against the settlement figure.

Investigate mismatches: If it doesn't balance, searches line by line within that shop's receipts for the cause — a missing receipt, wrong payment type, dummy cardholder name left in, or a fee included/excluded incorrectly — and corrects it in the booking where possible.

- Significant time investment to manually match every transaction line by line
- Extra training and expertise needed to correctly handle split transactions and edge cases like sports team debtors
- Slow, manual detective work required to trace and fix errors

Follow Up

Accounts

Travel Consultant

Customer

Chase unidentified amounts: Emails the whole consultant network asking if anyone is expecting a payment that couldn't be matched to a booking or shop total.

Close out actions: Follows up individually with whichever consultant responds, and/or the customer, to confirm and finalise remaining discrepancies (e.g. clarifying a deposit amount).

- Significant delay waiting for the network to respond and identify unmatched payments
- No clear ownership — depends on someone else recognising the payment

Scenario 02: Multiple BPay Payments, Multiple Travellers, One Booking + Reconciliation

Manual follow up for multi-payment mismatches

Several travellers on the same booking (e.g. three couples) each pay their own share separately via BPay, all referencing the same Tramada booking number; Accounts must receipt and allocate each payment as it lands, and distinguish genuinely separate payers from a single split payment.

Human Actions

Pain Points

Customer Payment

Customer

Travel Consultant

Advise payment details: Consultant advises each traveller/couple of their individual outstanding amount and gives them the BPay biller code and reference (the Tramada booking number), noting this is available directly on the quote document.

Multiple independent payments land: Each traveller pays their own share online via BPay, independently and on their own schedule — up to 3 working days to clear into RAA's account. Each transfer carries the same booking number as reference, since that's the shared BPay reference for the booking.

Receipt each payment as it lands: As each BPay payment clears, consultant or Accounts creates a Debtor/Client Payment Receipt in Tramada with Payer Name = BPay, allocates it against the correct segment/costing for that traveller (or leaves partially unallocated if the segment cost isn't fully known yet), and notifies the traveller their amount has been receipted.

- Each traveller pays independently, and BPay can take up to 3 working days to clear, staggering visibility of full payment
- Shared booking reference across travellers makes it hard to know who has paid without opening the booking

Reconciliation

Accounts

Pull the BPay report: Accounts logs into the Westpac bank statement, which shows BPay payments as a lump total identified by the deposit reference type, and copies the transaction detail into a working spreadsheet.

Resolve to booking level: Uses spreadsheet formulas (e.g. an X-lookup) to convert each BPay reference into the correct Tramada booking number, since the reference format differs slightly between the bank feed and Tramada.

Distinguish split payments: Manually determines whether multiple BPay lines against one booking number represent several separate travellers paying their own share, or one payer making a split/partial payment — this relies on staff experience rather than a system indicator, and is more complex when a debtor (e.g. a sports club) and family members are mixed on the same booking via a split profile.

- BPay's reference format differs from Tramada's, requiring spreadsheet lookups to resolve
- Distinguishing multiple independent payers from one split payment relies on staff experience, not system logic
- Debtor/split-profile bookings (e.g. sports teams) add extra manual complexity

Follow Up

Accounts

Travel Consultant

Customer

Resolve remaining gaps: Where an amount, traveller, or costing can't be confidently matched, Accounts follows up with the consultant to confirm who a given payment belongs to and how it should be allocated.

Confirm full payment: Once all individual traveller payments are receipted and allocated, confirms the booking's total outstanding balance is now zero before the segment can be invoiced.

- Ambiguous allocation requires following up with consultants to confirm who a payment belongs to
- Confirming the booking is fully paid requires manually tracking multiple partial payments

Scenario 03: Supplier Payment via Virtual Credit Card — JetStar & RoomRes

Lengthy DVC generation and payment with room for error

Since JetStar and RoomRes only accept credit card, the consultant generates a one-off Westpac Dynamic Virtual Credit Card (DVC/VCC) for the exact amount, pays the supplier's portal directly, and records everything back in Tramada; the transaction is written off against the bank statement once it settles.

Human Actions

Pain Points

Confirm Payment Type and Generate VCC

Travel Consultant

Confirm method: Consultant confirms the supplier only accepts credit card, and generates a VCC via the Westpac VCC Generator smart flow rather than using the store's physical backup card.

Populate VCC details: Enters the currency/amount, transaction validity period, agent initials and store code, Tramada booking number, supplier name, and lead passenger name; system generates the card number and expiry date.

Note the surcharge rule: Must remember to on-charge the member any supplier credit card surcharge in addition to RAA's own credit card fee.

- Manual, multi-field VCC generation required for every single supplier payment
- Easy to forget on-charging the supplier's surcharge on top of RAA's own fee

Pay Supplier & Update Tramada

Travel Consultant

Pay in supplier's portal: Enters the VCC number, expiry and amount directly into the JetStar or RoomRes portal to complete the payment.

Create the Agency CC Debtor Receipt: Back in Tramada, populates creditor details, agency credit card details and receipt details, then issues the Agency CC Debtor Receipt and allocates it to the correct costing/segment — checking the Debtor Due (Gross) figure matches exactly what was charged to the VCC.

Update the booking: Updates the hotel/flight segment with issue date, confirmation number and creditor invoice number, and adds booking notes confirming the supplier is paid.

- Same payment details re-entered manually across the supplier portal and Tramada
- Debtor Due figure can mismatch the actual VCC charge, requiring manual correction

Reconciliation / DVC Write-off

Accounts

Match against statement: When the Westpac statement later shows the DVC charge going through, Accounts writes off the transaction in Tramada against that specific VCC, using the reference details (booking number, supplier, amount) entered at generation.

Investigate mismatches: Where the charged amount doesn't match what's recorded (e.g. a supplier surcharge wasn't accounted for), traces it back to the booking to correct.

- Manual write-off per transaction, with no automatic link to the original VCC
- Mismatches (e.g. missed surcharges) require manually tracing back to the booking

Scenario 04: Supplier Payment via Mint — Journey Beyond

Repeated data entry across Tramada and Mint portals

For suppliers and creditors preferring Mint payment, like Journey Beyond, the consultant pays through Mint directly, then mirrors that payment in Tramada.

Accounts later reconciles against Mint's own daily report, which – unlike credit card settlements – includes a reference number per transaction.

Human Actions

Pain Points

Prepare and Process Mint Payment

Travel Consultant

Confirm costing is accurate: Consultant checks commission and nett amounts on the costing are correct before proceeding, since this drives what gets paid.

Pay via Mint first: Completes the payment through the Mint system, entering the amount and generating an 8-digit Mint reference number — this must happen before anything is entered in Tramada..

- Payment must be actioned correctly in Mint before Tramada is touched at all
- Costing errors only surface after the (irreversible) Mint payment has already been sent

Record Creditor Payment in Tramada

Travel Consultant

Open the payment screen: From Booking Transactions, selects Creditor Payment and Add/Issue Payment; sets Transaction Type to EFT and Bank Account to Trust Account.

Enter payment details: Enters payee name (lead passenger), payment date, and nett amount paid to Journey Beyond; enters the Mint reference number — this field is mandatory without exception.

Allocate & issue: Ticks the costing(s) being paid, previews to check accuracy, then issues — creating a unique payment number and updating the Booking Account and ledgers.

- Fully manual re-keying of details already entered in Mint moments earlier
- Reference number must be typed exactly, or the downstream reconciliation match breaks

Reconciliation

Accounts

Pull Mint's report: Accounts opens a statement page in Tramada and receives Mint's daily report, itemised with a reference number, amount and payee per transaction.

Tick and flick: Since the report is itemised, matching is largely a straightforward tick-and-flick against Tramada's statement page rather than a total-matching exercise.

Chase exceptions: Follows up any with an incorrect reference, missing costing, or wrong amount directly with the consultant who processed it.

- Still manual line-by-line ticking, despite itemised data being available
- Incorrect references or missing costings still require tracking down the individual consultant

Scenario 05: Supplier Payment via On-Account — Tokio Marine

Repeated entry and status updates for policies in Tramada

Some suppliers, like Tokio Marine, are paid entirely "on account". Travel consultantss convert the Tramada quote into an active policy directly in the Tokio Marine platform, record the policy details in Tramada, and invoice the client segment.

Finance settles Tokio Marine separately, in bulk, during their own periodic reconciliation.

Human Actions

Pain Points

Prepare and Process Mint Payment

Travel Consultant

Locate the quote: Consultant takes the quote number already sitting in the Tramada booking and looks it up in the Tokio Marine platform.

Convert quote to policy: Purchases the policy through Tokio Marine, which converts the quote number into a policy number — this is the moment the insurance actually becomes active.

Enter policy details twice: Copies the policy number back into Tramada into both the Policy No. field and the Creditor Inv No. field, plus the issue date and travel start/end dates. Checks the Policy Gross Amount and payment type ("Chargeable Pre-paid") are correct, leaves commission at its auto-defaulted 30%, and does not tick Apply GST.

- Manual double-entry of the same policy number into two separate fields
- Several easy-to-miss settings (GST, commission, payment type) must be manually verified rather than defaulted

Invoice

Travel Consultant

Invoice once receipted: Once the customer's payment is receipted in full, consultant invoices the Tokio Marine segment directly.

Completion signal is informal: There's no dedicated status flag confirming the policy step is done — staff simply infer it's complete because the segment has both an issue date and a policy number populated. If either is missing, there's no system prompt to catch it.

- No system indicator that the policy/payment step is genuinely complete
- Relies entirely on staff visually checking two fields are populated, with no prompt if missing

Periodic Reconciliation & Creditor Payment

Accounts

Bulk settlement: Travel Accounts reconciles Tokio Marine's entire account statement for a set period across the whole network in one pass; all the resulting creditor payments "drop in" together when this happens.

Filter by policy number: Uses Tramada's advanced search to filter by policy number (their equivalent of a reference number for this supplier), selects all matching results, and checks off against the statement.

Watch for policy-level discrepancies: A policy number can cover more than one line if an addition/extra was made to an existing policy — same policy number, different amount — so totals must be double-checked, not just the reference match, before ticking off

- No mandatory reference enforced anywhere, so bookings can reach invoicing without a policy number
- Same-policy-number additions require careful manual amount-checking, not just reference matching
